Week 5: EDA Charts and Frequency Analysis

Dataset: products(3).csv

Rows: 160 | Columns: 10

Full duplicate rows: 1

Classified records: 142

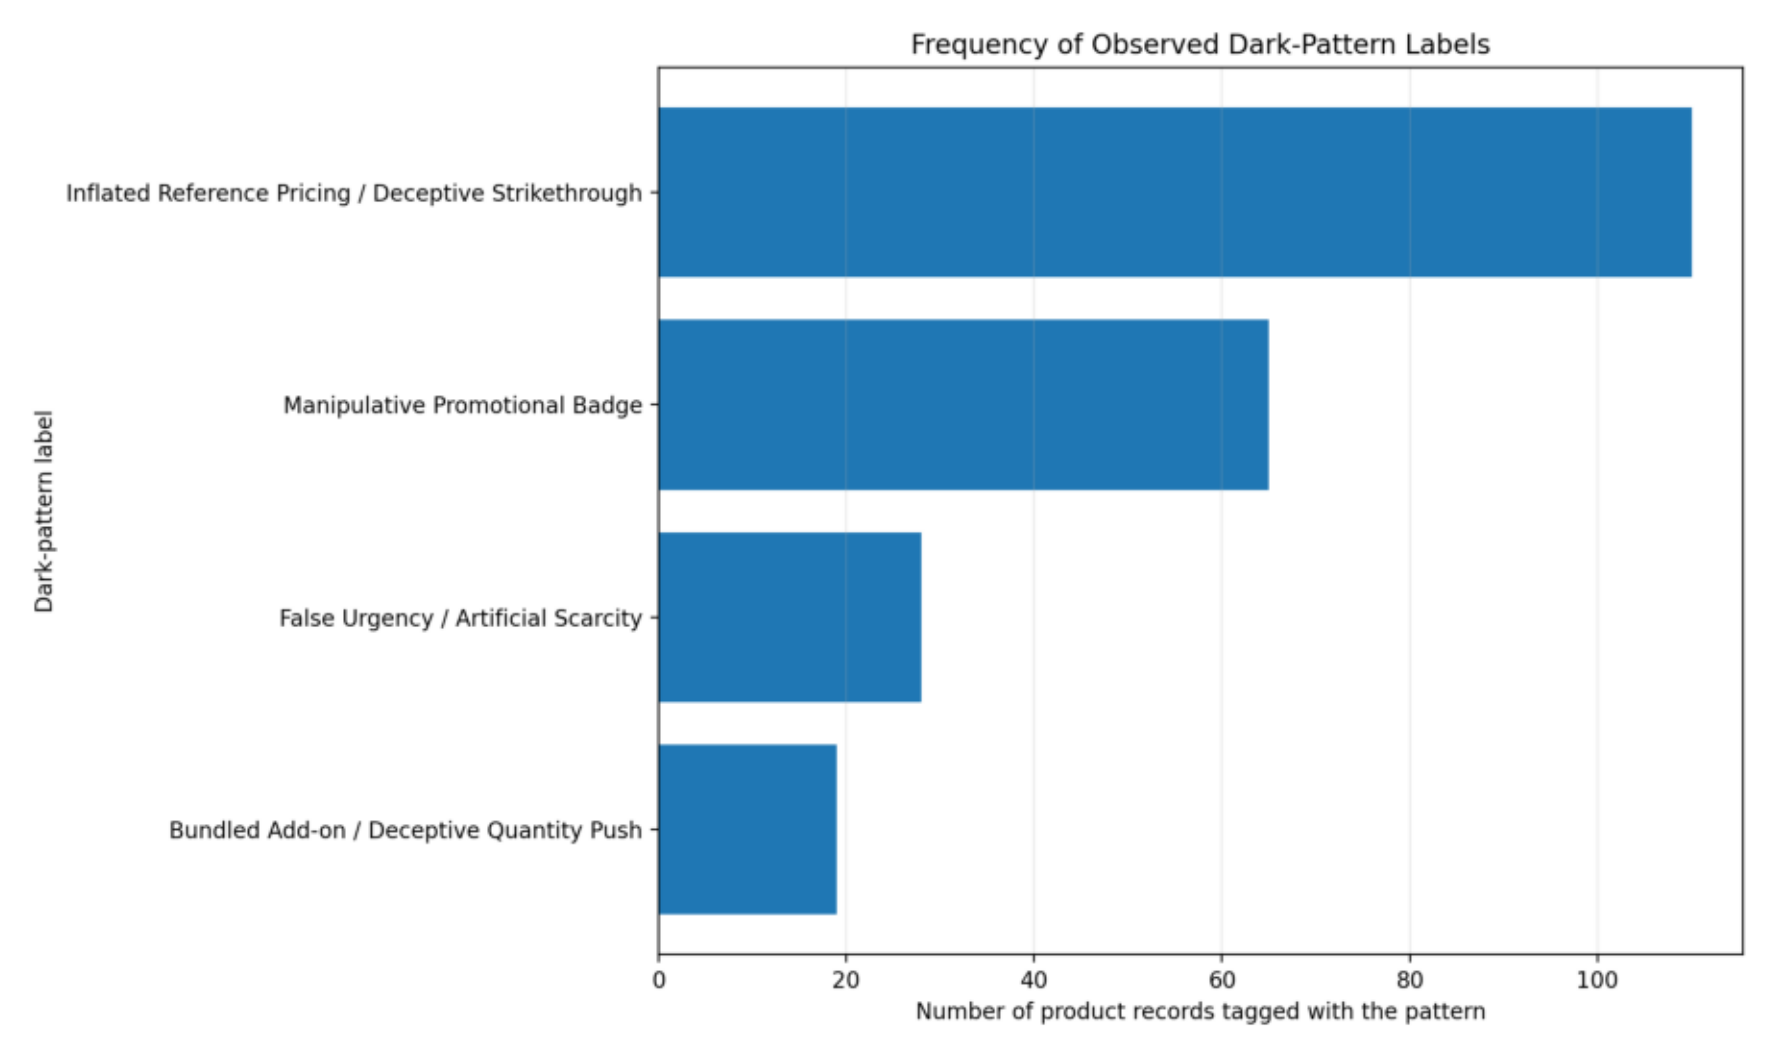

Unclassified records: 18

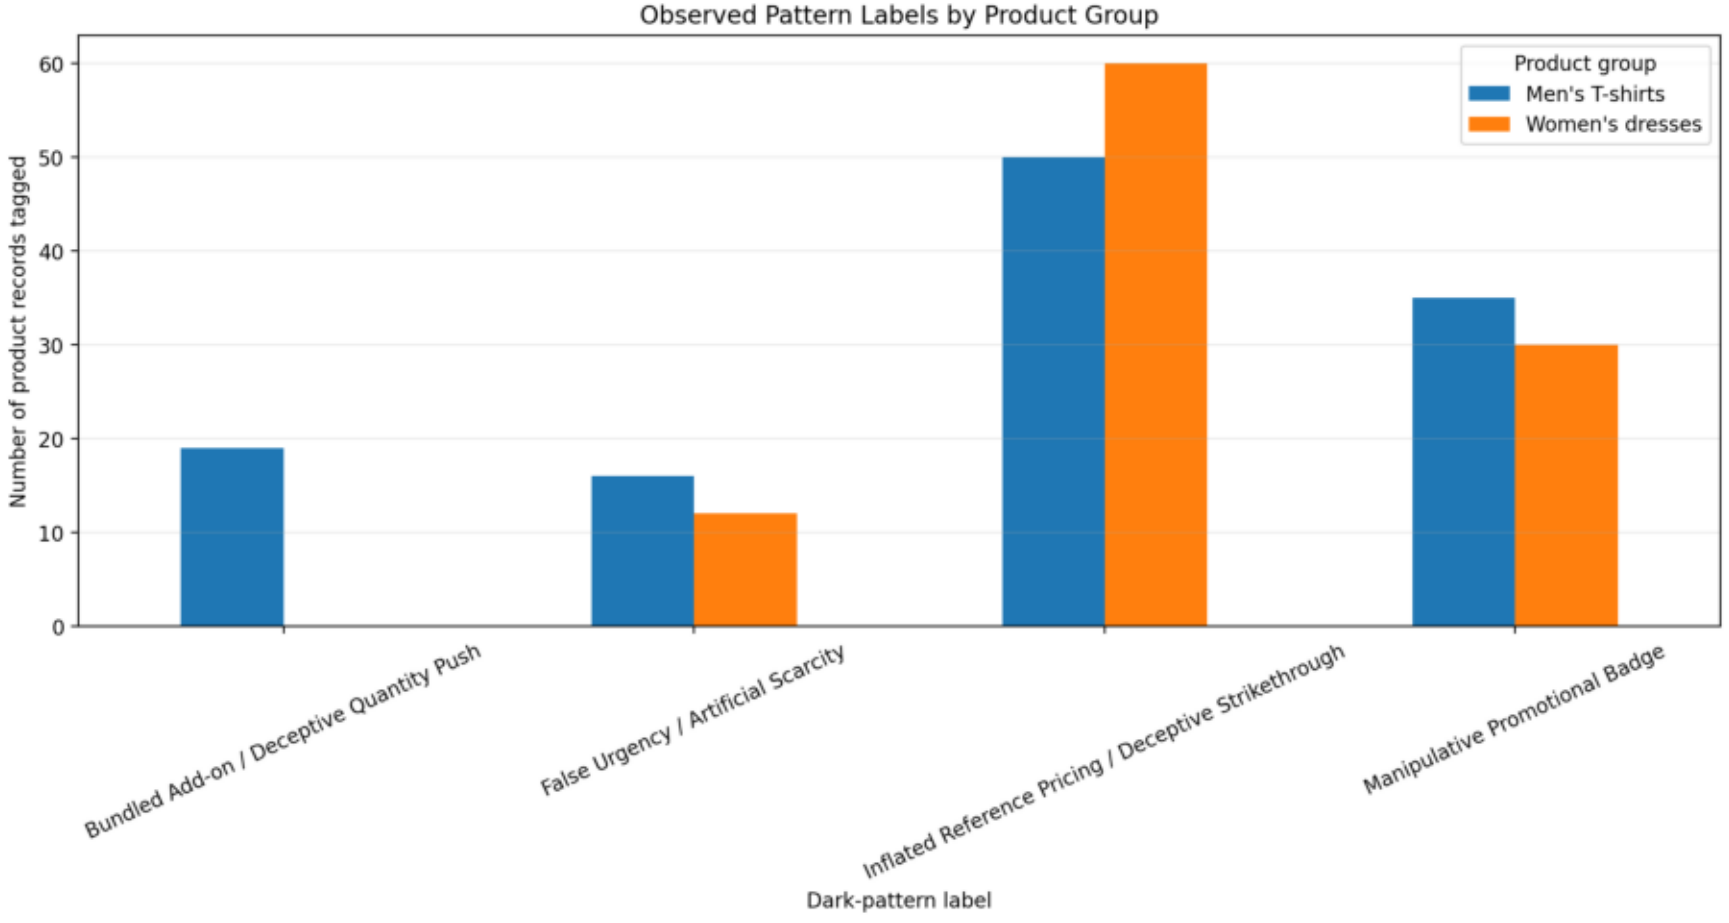

Product-link domains: www.flipkart.com

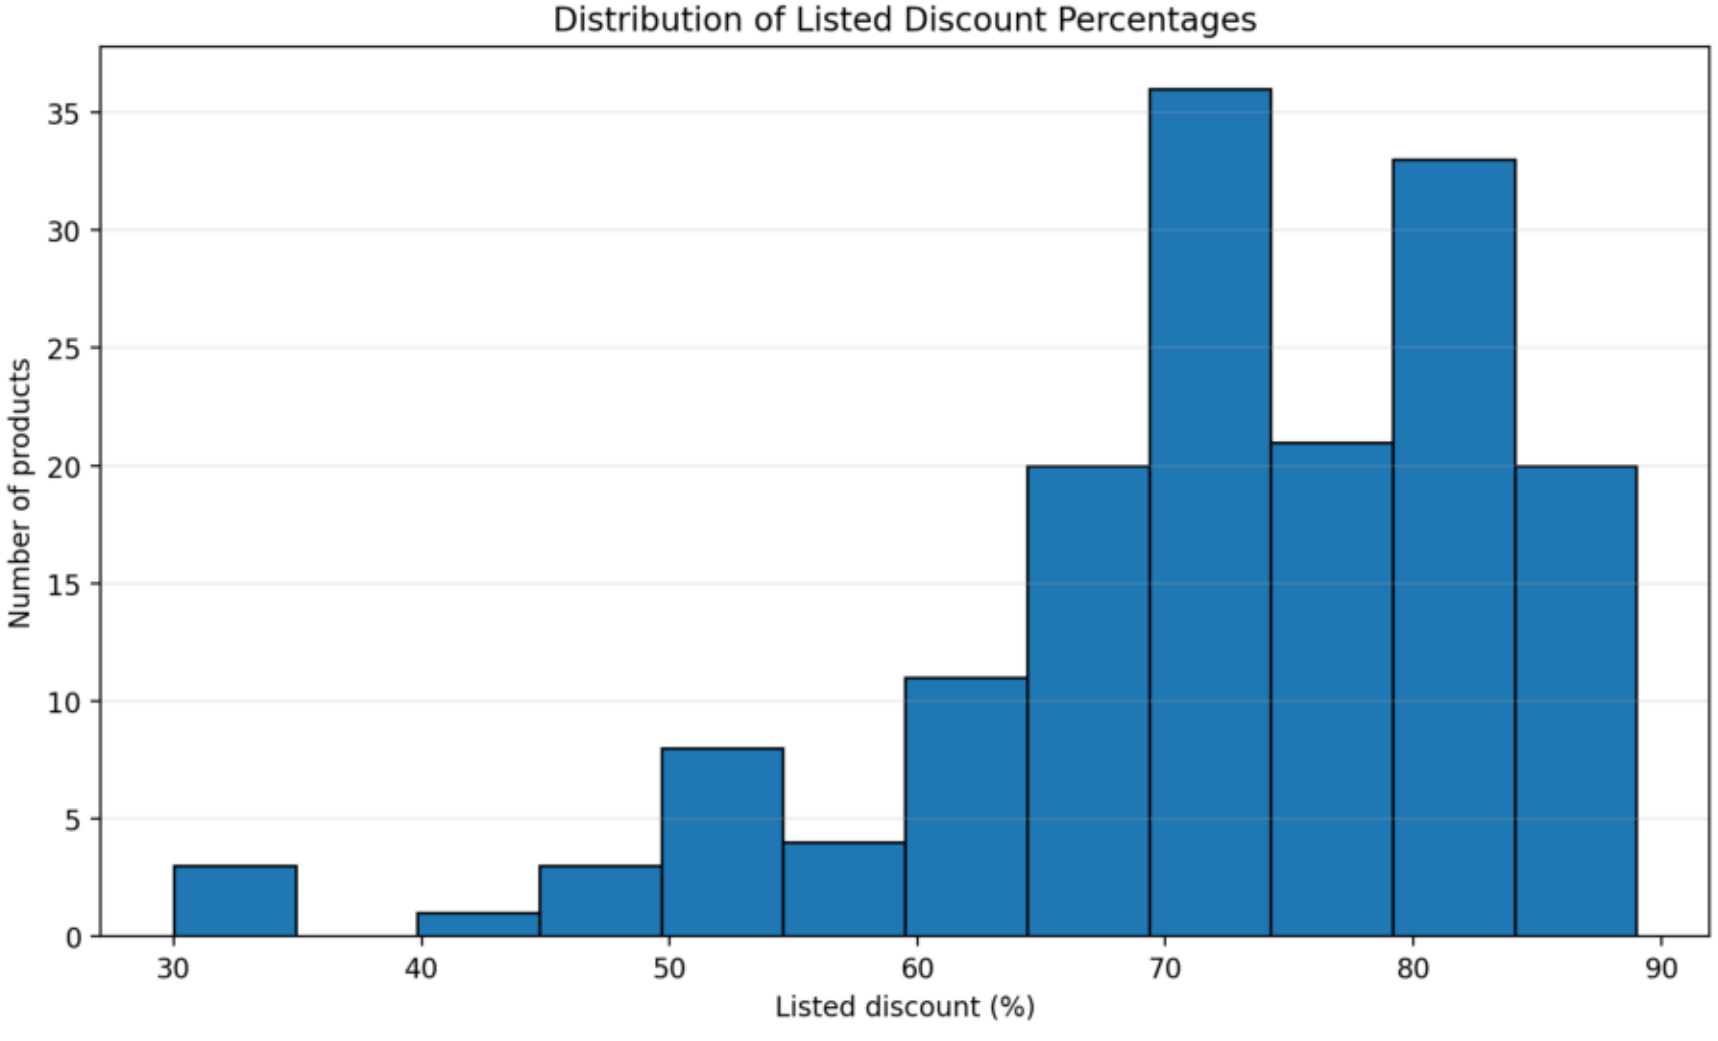

Product groups inferred from source URL paths: Men's T-shirts: 80; Women's dresses: 80

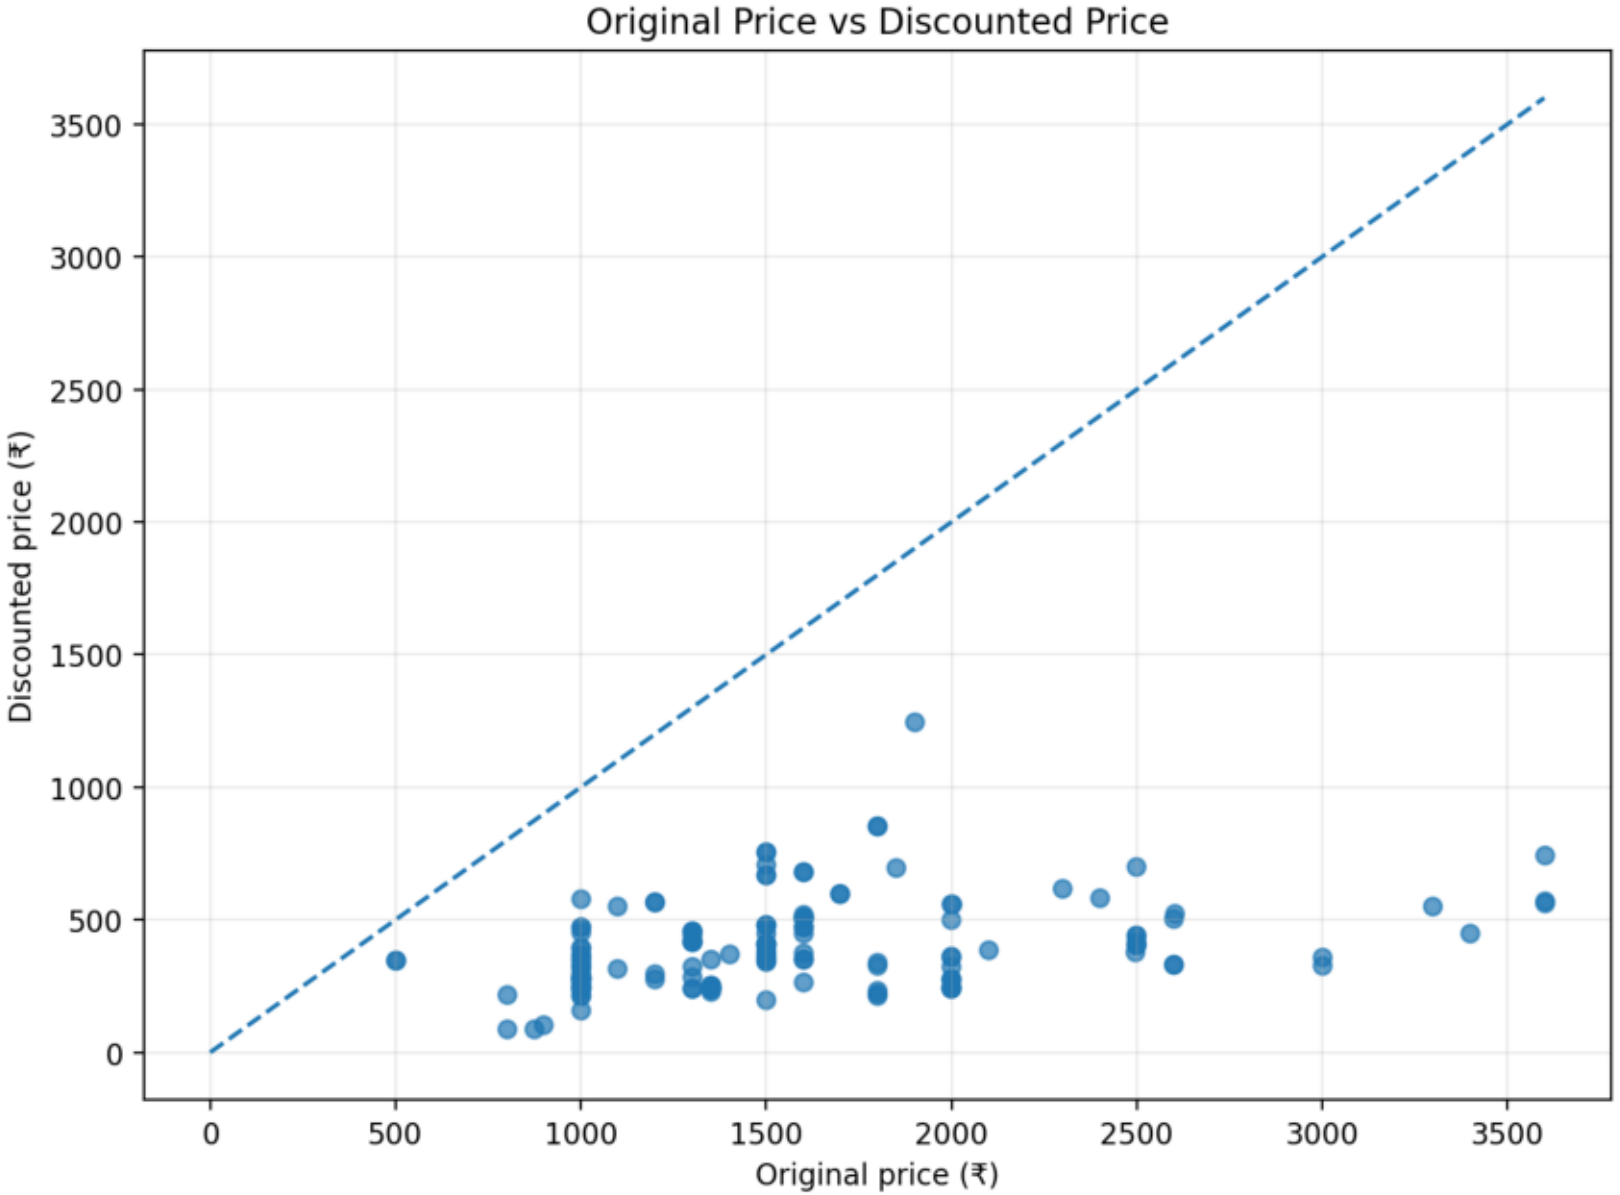

Interpretation notes:

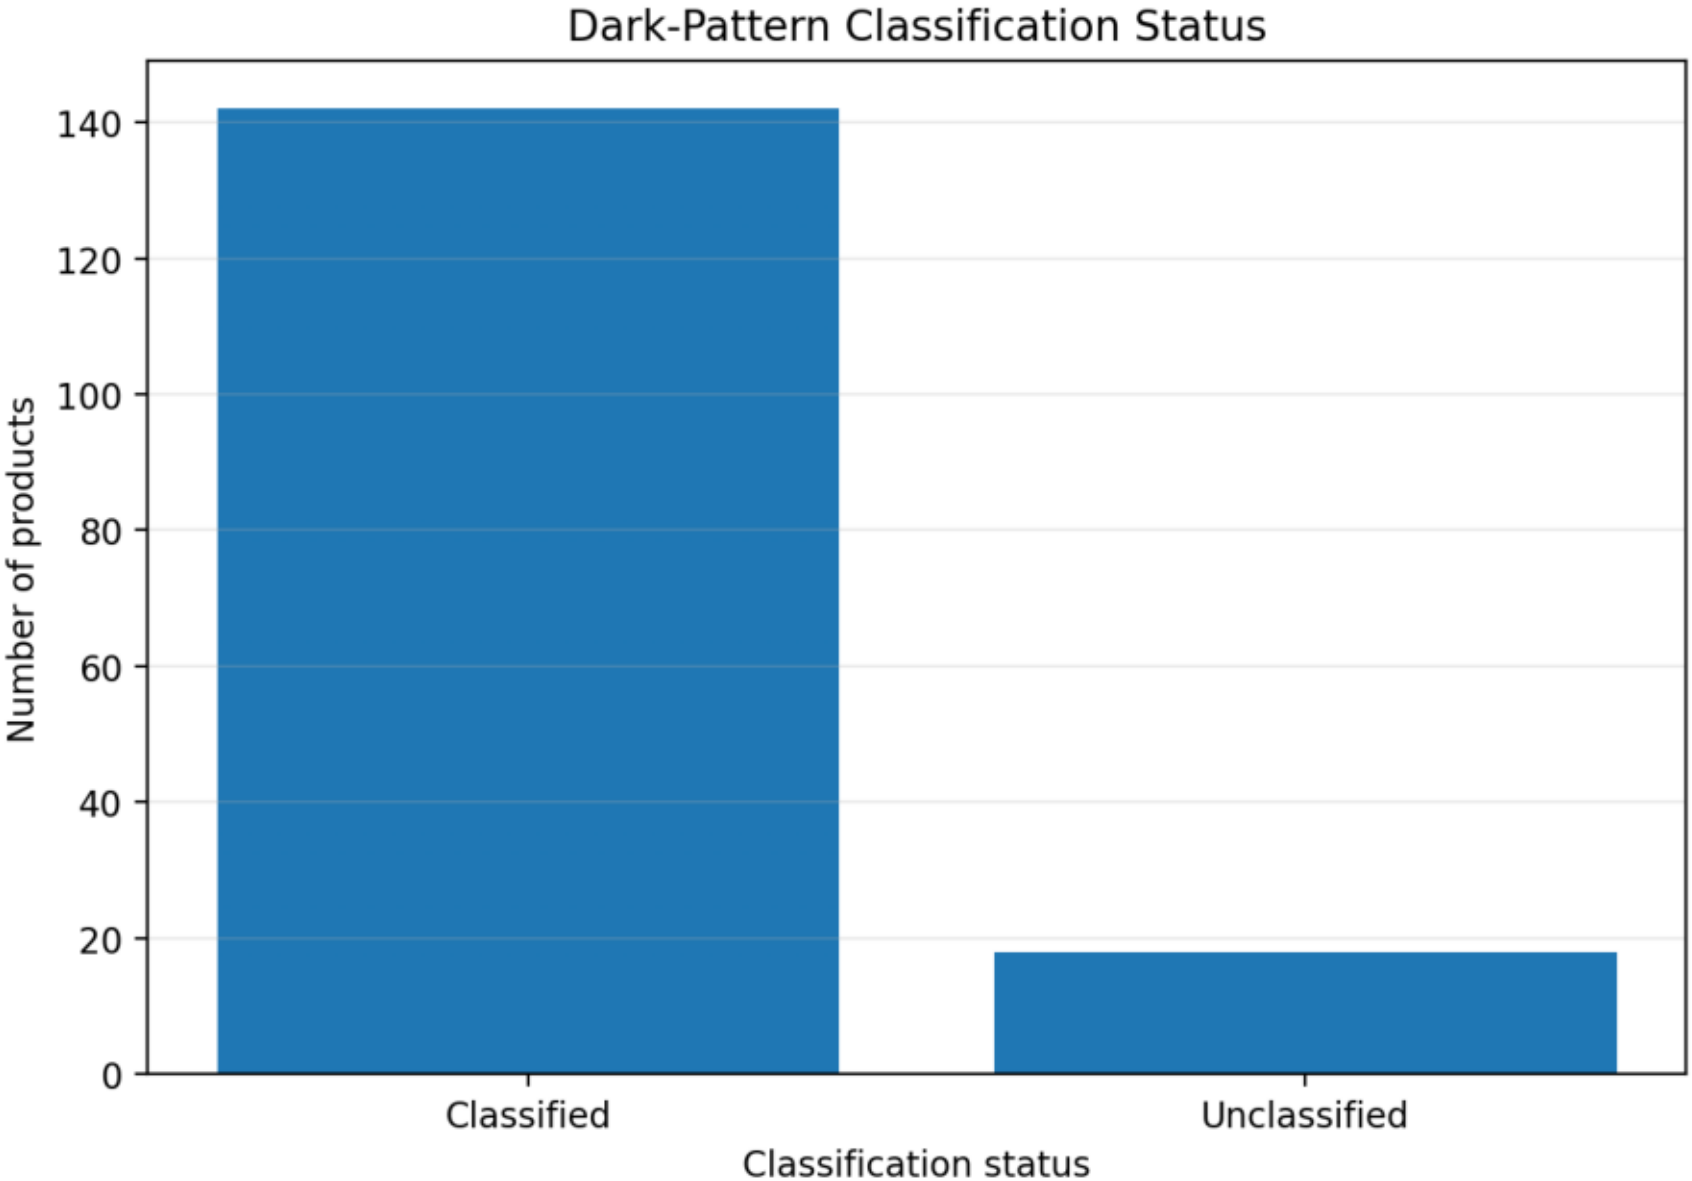

- Pattern labels were split on semicolons; one product can have multiple labels.
- Pattern frequency counts product records tagged with each label, not proven instances of deception.
- Unclassified records are kept separate; missing labels are not treated as 'no dark pattern'.
- The current CSV contains Flipkart product links only, so it cannot support a four-platform comparison.
- Product groups were inferred from source URL paths; verify them against the collected product links.
- Listed discounts and strikethrough prices alone do not prove that a discount is deceptive.
